

Local detector quality and request work across configurations

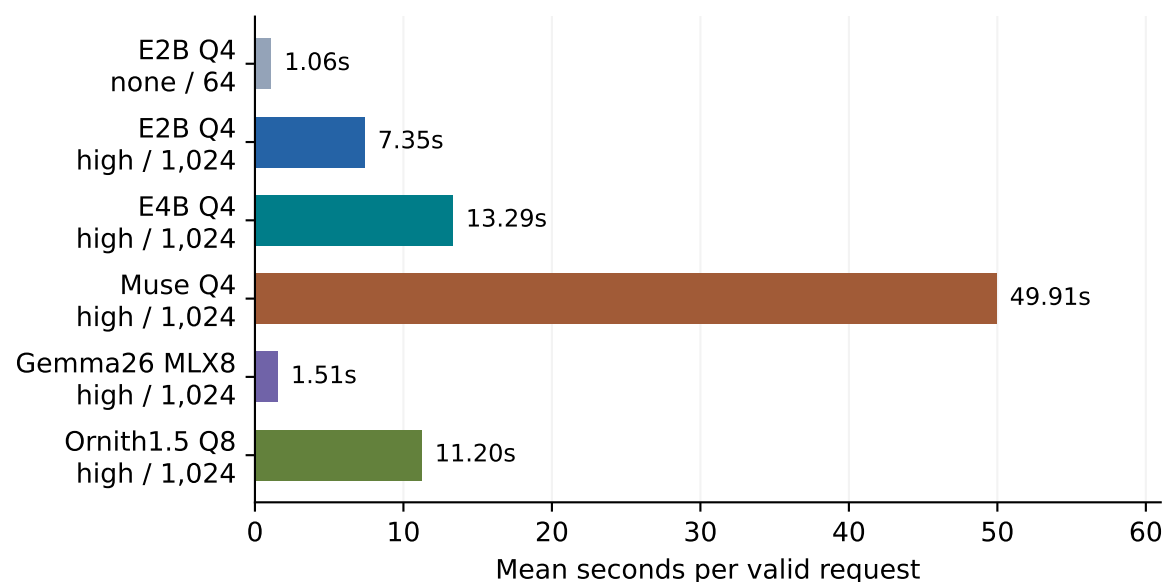

Numerical attack probe: flagged attempts

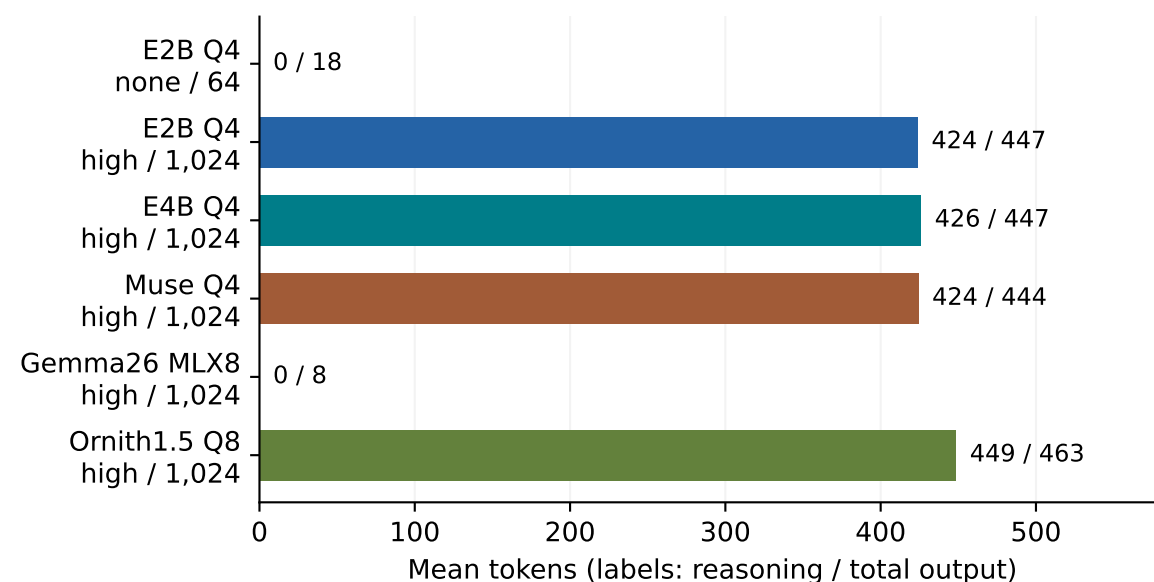

NotInject benign messages: false alarms

Numerical probe: request duration

Numerical probe: reported reasoning work

Fixed score >0.5. Numeric probe: 6 correlated paper families, 54 attempts + 18 controls; flags can still reflect payload compliance.

NotInject: 339 benign cases. Abstentions are excluded from rate/timing denominators and shown explicitly. Timing includes relay/device checks.

Requested settings shown; actual reasoning, quantization, backend and drafting differ. These are observed configurations, not architecture effects.
